

# Mesh Network

Our mesh network products offer a solution for applications needing remote monitoring and control over a wider area, combined with minimal power/current performance required by battery operated security and alarm systems, while still capable of supporting multiple units in a site.

## Control products

Sometimes the user application is more orientated towards control cable replacement than data transfer. For these users Radiometrix offers a range of industrial control products, with parallel (switch) inputs and power relay type outputs, again in both module (KTX and PL series) and add-on chip (CTA88) formats. A range of ready to use application boards are available, including units targeted at the FCC “MURS” band usage in the USA (MC types).
